## Sample Geometry Problems

 by Ross Atkins1. A pair of circles intersect at points $A$ and $B$. A line is tangent to both circles, at points $C$ and $D$. Prove that the intersection of $A B$ and $C D$ is the midpoint of $C D$.
2. Let $A B C D$ be a square and let $P$ be a point inside $A B C D$ such that $A P=B P$ and $\angle A P B=150^{\circ}$. What is $\angle C P D$ ?
3. Let $A B C$ be a triangle with $\angle C A B>45$ and $\angle C B A>45$. Construct an isosceles right angled triangle $R A B$ with $A B$ as its hypotenuse and $R$ inside $A B C$. Also construct isosceles right angled triangles $A C Q$ and $B C P$ having $A C$ and $B C$ respectively as their hypotenuses and lying entirely outside $A B C$. Show that $C Q R P$ is a parallelogram.
4. Consider an equilateral triangle $A B C$. Let $P$ be an arbitrary point on the shorter arc $A C$ of the circumcircle of $A B C$. Show that $P B=P A+P C$.
